

India's growing megacities

 sanskritiias.com/current-affairs/india-s-growing-megacities

(Mains GS 3 : Urbanization, their problems and their remedies.)

Context:

The rapid urbanisation across India and globally requires targeted and planned intervention to allow cities to grow in a sustainable manner as their green cover shrinks considerably.

Potential to improve:

- Urbanisation is an inevitable process of development that has the potential to provide privileged social and economic advantages, including better education, health, housing and employment opportunities.
- Though only half the world's population lives in urban areas with the ability to generate 80% of the Global Gross Domestic Product (GDP), urbanisation has a good capacity and rich potential to improve well-being in societies.
- As the UN World Cities report highlights, the urban population of Indian cities is projected to reach near 60% from 31% (2011) by 2050 and by 2030, India will have seven megacities which will include Ahmedabad and Hyderabad apart from New Delhi, Mumbai, Kolkata, Chennai and Bengaluru.

Urban green spaces:

- Green spaces in cities and towns besides providing various ecosystem services and public health benefits also offer services of psychological relaxation, stress reduction, physical activities and reduction of climate-related vagaries such as pollution, heat waves, etc.
- One of the major reasons warranting the need for urban green spaces is the fact that apart from consuming a huge quantum of natural resources by our cities, almost 70% of all greenhouse emissions is generated from an urban built environment.
- Trees in megacities may save nearly \$500 million per year in services including environmental protection that make urban environments cleaner, more affordable and more pleasant places to live in.
- Urban green spaces have become essential for city planners and managers to mitigate negative environmental consequences and ensure a delicate balance between development and the environment.

Highlight at various forums:

- There have been various international meetings, conferences and agreements to improve access to fair green space to achieve the objectives of sustainable urban policies.
- Ensuring environmental sustainability is one of the three interlinked principles of the New Urban Agenda adopted at the United Nations Conference on Housing and Sustainable Urban Development (Habitat III) in 2016.
- The importance of green space has also been highlighted in Self Development Goal 11 dealing with sustainable cities and communities to make cities and human settlements inclusive, safe, resilient and sustainable.

Nature-based solutions:

- Green space and other nature-based solutions are an essential component for the development of sustainable, resilient and inclusive cities.
- The World Health Organization (WHO) has recommended per capita green space of nine square metres besides access to public green spaces within 300 m linear distance or a five-minute walk from the houses of urban residents.
- In terms of decadal change of forest cover in seven megacities, the FSI Report 2021 noticed an overall increase of 68 square kilometres in the last 10 years.
- All megacities witnessed poor decadal growth except for Hyderabad which has witnessed a maximum 147% increase in forest cover. Hyderabad is the only city that has seen a decadal increase in per capita forest cover from 4.3 to 8.2 sq. met near the recommended green cover of 9 sq. met.

Delicate balance:

- Urbanisation is an inevitable and important component of development and is considered an integral driver of a modern economy thus, being a leader among developing countries, Indian cities cannot become an exception to growing urban growth and development.
- To ensure a delicate balance between development and the environment, the activities aimed at a reduction in negative environmental externalities and their impact on natural resources and environmental services as an important aspect of green growth have become essential for city planners and managers.

Loss and fragmentation:

- Densification-prompted activities causing a rapid loss and fragmentation of both public and private green space are one of the major challenges influencing urban green space.
- Additionally, activities such as infill development and redevelopment of land coupled with the real estate boom and skyrocketing land values always force a citizen to go in for maximising economic benefits with little or no priority to green space.
- These factors along with the lack of necessary policy support, priority and funds make urban green space-related issues insignificant and inefficacious.
- A lack of concern among citizens and official laxity in the strict implementation of regulations related to the maintenance of green cover further worsen what is already a bad situation.

Way forward:

- The 3-30-300 rule of Cecil Konijnendijk stipulating the ability of everyone to see at least three trees from home, the presence of 30% canopy cover in each neighbourhood and a maximum distance of 300 m to the nearest park in a city needs adoption to the extent possible for a greener, better and more biophilic environs in our cities.
- Strict compliance of environmental obligations, including green space by user agencies, needs to be enforced without exceptions.
- Innovative concepts such as nature-based solutions, being 50% cheaper than grey alternatives and delivering 28% greater environmental benefits need to be incorporated in future urban planning.
- Together with multi-stakeholder involvement, adequate financial resources, and institutional support, this will strengthen urban governance to reorient our strategy of urban planning and management.
